

Title: When a turret is destroyed, don't the general rules of wave management stay the same except that the lane has become longer?

Score:

--- POST CONTENT ---

Like for example, if you dont properly shove, you're hemorrhaging minions. You can freeze, slow shove, and ping pong, and each come with basically the same advantages and disadvantages.

Maybe not a crazy revelation, but in all my years of playing this game, I don't think I've seen anyone mention this.

Not really.

There are numerous reasons why, but the biggest is essentially it isn't just a bigger lane, because the *jungle* becomes part of your lane, now.

The turrets are placed in strategic spots that 'close off' exits of the jungle, making them a distinct side of the map that is controlled by one team or the other. There are no true entrances to the jungle from a lane that hasn't lost any turrets. The only exits from the jungle are *behind* those turrets, making them dangerous to explore by an enemy. But when turrets go down, those areas of the jungle that are connected to those openings now become both part of that lane, as well as a no-man's land.

Who 'owns' that part of the jungle depends on who is stronger/winning, as well as the location that

the minions are currently crashing, because that gives 'safety vision' that, while not always reliable, is considered more safe than not (in the same way that you can expect the big rock on the side lanes that has an awkward tribush next to the cliff side to be safe unless the enemy has a Zac or similar).

On top of this, the meta dictates that when you destroy a tower, you start pushing your lead to other lanes and start grouping up for objectives, unless you're split pushing. But even a split push isn't really "laning" anymore, because you're usually not just sitting in the lane, and there are a ton of extra dangerous openings from the jungle that other enemies can pop out of as well.

To your specific points about hemorrhaging minions, shoves, and ping pongs: Yes you can *kind of* do this (though a hard shove will usually still meet another wave before it crashes into the inner turret), but it has very distinctly different advantages and disadvantages. Now it's about creating PRESSURE that the enemy feels they need to respond to (either because they don't want to waste all that gold, or the potential of a split pusher pressuring the turret), rather than controlling the wave for trading and the like.

CS/min starts to go WAY down for everyone except explicit split pushers like Yorick or Tryndamere after the outer turrets are all gone, because yes, you end up hemorrhaging minions in favor of being with the team for objective control. Thinking of it as "hemorrhaging minions" is not really the correct thinking, though, because the correct play is quite often to just let them die to each other. If there are no objectives up soon, and it is safe to do so, that is when you catch the wave.

Yes and no because if you overextend you can get ganked from more angles

Because except if ur on the losing end it doesnt make a lot of sense to freeze at t2 f.e.

The game is played way too quick for you to chill on lane freezing in minute 15. You rather hardshove and roam or farm jungle camps. This makes you gain more gold. You dont win from starving ur enemy, there are 4 more ppl you have to take care of.

Also by then you dont need a big wave to dive anymore since tower damage isnt that high anymore and you can basically kill everyone with a full comb of 2 champions, even hyper tanks such as ornn or sion should die if not crazy fed.

Wavemanagement costs time, its most of the time quicker to just shove, even if the "optimal" play was to freeze or set up a big wave to collapse. As said u can do more with ur time if you just shove.
