

Title: Wave Management after a kill

Score:

--- POST CONTENT ---

I'm sometimes unsure what to do with the wave after getting a solo kill against the enemy midlaner, usually I would try and shove but I don't think this is always feasible. For the following scenarios after a solo kill, what is the best course of action?

The wave is crashing towards their tower

The wave is crashing towards my tower

The wave is slow pushing to their tower

The wave is slow pushing to my tower

The wave is in a neutral state

The wave is crashing towards their tower:

Great! Wave state is fine, make sure it crashes asap. Get as much cs as is safe. If enemy jgl catches and freezes it while you back you type: ?jgl diff?

The wave is crashing towards my tower:

Suboptimal. Depending on your safety and pushing strength, either thin it out, recall and come back to a big wave or freeze. Or push it all the way out, this gives you more gold but takes longer and gives the enemy tempo.

The wave is slow pushing to their tower:

Wave is garbage. You either fix it by pushing, sometimes junglers can help after gank, or you take the W on the kill and the L on the wave.

The wave is slow pushing to my tower:

Nice wave! Almost the same as point 2, you just don't have to thin it out, therefore you can recall faster. Pushing it out is still viable.

Keep in mind: freezing is value, pushing is tempo/pressure. Early game champs want pressure, lategamers want value

Edit: forma

If the wave is pushing towards you and won't crash if you reset, reset. Otherwise thin the wave so that it won't crash.

If it's pushing towards them and you know where the jungler is/win a fight against the jungler push the wave and reset. If pushing the wave results in your death, take the L on the wave and reset anyway.

I agree with what the other person said, except if it's possible for you to crash it when it's neutral, crash it.

EDIT:

The mechanic behind crashing the wave is that either the wave will die before enemy minions arrive, resulting in a neutral wavelstate, or it will get under tower, enemy minions arrive, and the minion's programming is reset, causing it to slow push toward you.

This is honestly a really complex question. The simplest way to start gaining an understanding of your options is to start considering how long you have before your opponent returns to lane. A good starting point is to prioritize being out of lane by the time your opponent returns to lane. I believe for midlane it takes roughly 15 seconds with homeguards to get to lane from base.

Personally I try to keep an eye on where the next wave of minions are and remember where my opponent is relative to that wave. Thinking about it that way can also help you make decisions on whether or not you can crash. If your opponent should be right in the middle of the next wave crashing is going to be tough.

In general slow push to them: very bad push it out asap and recall.

Slow push to you very good.

Neutral, it tototally depends on matchup and game state. Example im vlad vs zed, get solokill. Noe i can push wave but if i do zed will be back before me kill the wave and roam, this can legit lose the game and is my fault. Instead recall immediately so zed cant roam.
