

Title: Macro Guide | Wave management Guide | 6 Examples

Score:

--- POST CONTENT ---

Yo, Slunt here!

I've broken down wave management into 6 different examples/scenarios to try to help you all out.

If you all can think of any other scenarios (I KNOW THERE ARE A TON/EVERYTHING IS SITUATIONAL) to help each other out then please comment below.

​

Edit 1: Thank you all so much for all of the discussion going on below, this is exactly my intention. Talking through different scenarios about the best outcome.

Edit 2: Appreciate all of the awards/support, you all are the bomb.

​

1. You just killed your enemy laner solo:

Majority of the time after killing a solo laner you want to push the wave into the enemy tower as soon as possible especially if this wave isn't a Siege Cannon Wave. Pushing the wave into the tower denies the enemy laner at least 130 gold + Experience.

If this wave is a Siege wave then generally you want to leave the wave if it is an even wave. If you

were to push the Siege wave by yourself the enemy laner will usually be able to get back to lane in time to kill the siege wave or at least 5 of the 7 minion on that wave. The rationale behind this is that the tower takes a lot longer to kill a siege minion allowing the enemy laner more time to walk back to lane. If you were to just leave the wave as is, you will deny the enemy laner 3 minions instead of 1/2 minions.

2. Freezing

If you killed your enemy laner and their wave is much larger than your wave this is also a good opportunity to freeze the wave. This will likely put them in a bad position whenever they get back to lane. Freezing the wave in this scenario will deny them at least 6+ minion and force them to put in the danger zone of their lane.

Freezing the enemy laner will force them to make risky plays to break the freeze or they will have to call upon their jungle to break the freeze (wasting their jungles time)

​

3. You + your Jungle killed enemy laner:

Generally when you and your jungle are able to pull off a kill you want to ping for assistance to help push the wave, this includes Siege minion waves. You and your jungle will usually be able to push the wave fast enough so that the enemy laner will miss all 6 or 7 CS/EXP. This will also potentially give you more time to get a plate/make your next move.

​

4. Roaming

Roaming should only be looked at if you believe there will be guaranteed gold for your team. You have to be gold hungry in solo/duo queue. If you are mid lane and the enemy bot lane is pushed to your bot's tower and it looks like a juicy roam opportunity you have to ask yourself. "Do they have their summoners" "Is my bot able to follow up this roam" "What does my current wave look like." Generally I like to roam after pushing in the second of three waves, knowing that the cannon wave is the third. As soon as you push in the second wave this will allow you a lot of time to pull off a roam and make it back to lane with minimal cs/exp lost.

​

What you don't want to do is roam on a bad wave, and gank a lane that is able to get away easily or 2v3 you + your bot lane.

​

5. Pushing Before Objectives

Planning an objective 60 seconds + in advance is key to securing said objective. If Dragon or Scuttle crab is coming up you do not want to be pushed under your tower because if your jungle needs you, you will be late to the fight/lose cs and experience. Ideally before these objectives you want to push the enemy under their tower so you can more quickly roam towards the objective if your help is needed. Pushing to help your jungle out can go a long way.

​

6. When not to back/When to back

An old coach once told me: "you want to spend as much time in the game as possible"

This has helped me a great deal with climbing. Before I back I always ask myself "do I actually need to recall right now." If I can stay in lane safely and soak up experience/gold I'm going to try my best to do so.

If there are objectives coming up and you have enough health/mana to try and contest then there is no need to back. You backing will put your team at a major disadvantage.

If you do have to back you want to try to back after shoving the enemy wave so it will allow you the most time to get back to lane. If you back before doing this and don't shove the enemy will be able to shove your wave and deny you a wave of cs/exp.

Generally backing before a siege wave will allow you the most time to get back to lane and conserve the most cs.

​

I KNOW there are tons of different scenarios and I really want to hear what you all have to say. If you have any examples that you think people may benefit from, PLEASE throw it down in the comments.

Most of these concepts are pretty standard and obviously situational. I think that understanding these full and through can help out new players a lot.

What do you do if enemy laner is trying to push you to tower? Being on the tower can cost you a lot of cs if you can't last hit, especially bot lane if your adc is out of lane.

One good tip is to tank some damage from the pushing wave if you are able to, to keep the wave from crashing onto tower. That can put your lane in a good, frozen position.

Can someone give some tips that take mana into consideration? If I'm unable to quickly push a wave because I'm out of mana, would it be better to just back?

How about matchups where the enemy laner has better push potential? E.g., I'm Lux and I'm against a Yasuo. I need to go back but I can't really outpush the Yasuo, and going back means he

gets to push + get plate gold. Should I also take the L there? I imagine if I'm playing a champion that's horrible at pushing like LeBlanc or Vayne that could also be something to think about.

Thank you for this post! Macro is the fun part of league for me

Edit: Thanks everyone for the awesome responses! I hope this will be of help to anyone else reading this. Happy climbing, and let's all remember to focus on improvement before all else, even if it's hard ?

Just a note about staying ?in game? for as long as you can:

Kills mean nothing. You may have killed your enemy lamer two times in a row - but if you haven?t spent the gold gained by it, or haven?t achieved a significant exp advantage that leads to a level advantage, you?re actually at a disadvantage (as the enemy lamer spent gold while you did not).

High level players often recommend to ?reset when can? - or ?never play two turns?.

That is - kill, push, reset and don?t greed. Small and steady wins help consistently win games... being greedy often throws them.

Only thing really missing from this post is Teleport usage - otherwise pretty spot on as a general guide.

Teleport usage (for toplane waves) either come in the form of get out of jail free, or to setup up a freeze.
