

Title: (adc) (wave management) a little question about why this player did this

Score:

--- POST CONTENT ---

Hi! so i'm just another terrible gold adc, and recently i've decided that i want to finally wrap my mind around Wave management. I'm trying to repeat and practice the fundamentals about the wavestates, but the problems come when a lot of random things happen during the games and the concepts seem not so clear no more (is this pushing to me?, is this really a freeze or will it be easily broken?, is the enemy adc coming soon or he loses these minions? etc)

that said, heres a replay i'm watching. And i notice in this particular instance, the kaisa wants to build a slowpush -i think-, but to do so, he goes forwards and tanks the wave a little, pulling it -again, i think- so that both waves meet a little bit more forward than anticipated.

My question is, is there really a critical difference that im not seeing, than if he would have let the waves meet closer to his turret?

I ask this because i noticed that the slow push that formed, when the next wave arrived, was very big and effective really fast, granting a nice recall timer, i think. My guess is that if he would have let the waves meet closer to his tower, it would be easier for enemy Lucian to break it and crash them, no?

Also if anyone has a good vid or ideas about pulling the waves in general, i would really appreciate it! For context i'm terrible at logic, i'm more like a creative person LMAO like my brain works more with music and photography and other shit that i do irl, but when i need to think about this kind of stuff logically i just shut down. I think you can see it.

Thank you very much!

link to the vid at the minute i mention:

I briefly watched this and there is only ONE possible reason he could have done this: He didn't want to be killed on the slow push so he made the lane even.

For some reason he got killed by nunu anyways LOL! So actually it was a very intelligent idea which he fucked up for some reason. If he kept the lane even knowing he couldn't push, that could potentially have saved him from the gank

[Comment 2 | Score: 4]

By forcing the wave to meet closer to the middle, it gives him more time to build a slow push. Had the wave met closer to his turret, he would probably only have time to crash 2 waves.

What he did allowed him the chance to build and crash a 3rd wave, but that didn't end up happening due to dying to the gank

That said, I've never employed this specific strategy. I've pulled a wave to manipulate it, but what he did was so minute I almost didn't notice it change anything.

But yeah. I'm pretty sure he just does it to give him more time to crash.

[Comment 3 | Score: 2]

edit: i notice that at that moment, his jungler is botside, so maybe he did that to make more room for him to set a gank on the bush? or maybe i'm just overthinking it all? lmao

[Comment 4 | Score: 2]

If you don't clear a shoved minion wave until the next wave arrives, it will bounce back into the enemy instead of resetting to neutral. By pulling the wave a little bit forward, he is trying to reset the wave to neutral or at least make it push a bit slower.

[Comment 5 | Score: 2]

This particular way of pulling the wave when they are resetting (ie. crashing in the middle) is so that you can make the opposing melee minions focus on one of your own melee minions, which will die faster making the entire enemy wave push faster by killing all your melees.

By having the wave on your side faster you can more easily build up to a freeze, or if you're thinning the wave properly you can build up a 3 wave crash. You have both options.

If your jungler is coming for a dive, you'll have a giant wave to crash, if your jungler goes topside you can farm safely close to your turret.
