

Title: Wave Management in real games

Score:

--- POST CONTENT ---

Hello everyone I hope you are having a great day! So basically i've watched tons and tons of wave control guides and education LoL content but still cant apply it in my games. I play Yone Top lane and it just seems impossible to do anything. Im silver so that probably explains why but still. It's really infuriating trying so hard and watching so closely just to fail miserably when its actually time to do it. If any fellow top laners have tips please share.

Thanks to everyone who viewed/replied to my post I wish you the best day ever <3!

Wave management is easy once you realise what it actually is , its hitting the wave vs not hitting the wave at its core , so all you need to know is what to do either for the result you want to have.

For example , enemy is something weak early like a Kayle lv4 and you are a Darius lv4 as well , if you run her down , she is dead, but she knows it and hides under turret , so what can you do here? not hit the wave and position yourself in front of it to deny gold and exp to the kayle to build a lead. What you did here is a Freeze.

Scenario 2 , you just killed your lane opponent , the wave is in the middle of the lane, you push it as

fast as you can so it hits the enemy turret and instantly recall , in an ideal scenario you get at base as your new wave spawns and you get to lane with it , this was a Shove , it ensures the enemy wave is slowly getting back to you as you approach the lane , and thus the opponent that is likely behind since they died(works if they recalled at bad time as well) needs to be at a dangerous place to farm , so they are either in kill range or they hide away again in which case you can do a Freeze again.

Shove and Freeze are the basics of wave manipulation and all you need to know is when and why to do it. And all it requires from execution is hitting vs not hitting the wave.

A lot of the times, it is also the pattern recognition aspect. How many seconds does it take for you to glance at a wave, and know in 30 seconds where that wave will be? A gold player may take 3 seconds, a diamond player takes 1 second, a challenger player takes 0.2 seconds, etc. If it takes you too long to identify a wave state, you won't even have the chance to set up a wavestate you want because the moment has passed, or you autopiloted and spammed abilities on the wave, etc.

If you attach a replay, people will be more than happy to go over it with you and offer advice.

The problem you're probably experiencing and I had this issue back in silver as well was the RNG nature of your opponent laner and what to do with that?

[Comment 4 | Score: 1]

Could you describe in a bit more detail? Saying you're just failing makes it hard to give specific advice beyond what you're already getting from other resources. Which part are you struggling

with? Are you able to control the wave, but chasing to put it in states that turn out to be disadvantageous? Is the enemy laner contesting your ability to control the wave? Or maybe you struggle to predict how each interaction will impact the wave state? If you really aren't sure, posting a clip might help us, but it probably means you need to review the basics of what wave control is, how it works, and what to use it for.
