

Title: Are minion waves somewhat random or am I getting my wave management wrong?

Score:

--- POST CONTENT ---

I feel like sometimes a random melee minion just ignores the creep wave and goes straight for the tower or I let a full hp 6 minion wave run into a 6 minion wave in mid and come back to a ruined wavestate where somehow 2 of my creeps but only 4 enemy creeps died.

the tower thing is usually a melee minion thats doing whatever the fuck.

your second point could been due to minion buffs which they get when their team is ahead

[Comment 2 | Score: 45]

like others have said, especially in situations where it's pretty close (you might have a freeze you might not) there definitely is a degree of minion RNG which can be pretty annoying.

edit: typo

[Comment 3 | Score: 69]

Yes they are. AI is shit coded, so melee minions sometimes ignore enemy melee minions and dive into bunch of your range creeps. Or they change target for absolutly zero reason. Or they can target you when you stay in fog of war under tower and do your recall.

[Comment 4 | Score: 12]

Left uninterrupted, 6v6, it's random. It depends on which wave focuses single minions more often. If each side does 100 dps (random number for simplicity), it's even, but if they focus a minion randomly and kill it faster than the enemy minions kill one of their minions, then there's one less minion for a second or 2 which cuts down on the dps. Do that 3 or 4 times, and that's a pretty big damage deficit.

As for the minions going after the tower, try freezing the wave a little further away from the tower and that'll fix that. If your caster minions are right outside the edge of tower range, it'll work pretty well.

Im seeing a lot of 'its random' but its not as random as people make it seem

The reason for minions who randomly switch targets is called 'call to arms' and is based on other friendly minions getting low on health
