

Title: when do i, as a jungler, manage the wave when i gank?

Score:

--- POST CONTENT ---

Bwsicly the title. I am a gold1 jungle main. I rarely dare to touch my laners wave, as they always ping me back. I only do it when they communicate that i gotta take the wave.

But when should i actually do something with the wave? When should i shove, when should i freeze, when should i let their minions push?

It all really confuses me. Thats why i am jungler ?

General rule of thumb: if the lane is slowpushing (you have more minions than they do), your laner is dead/low health, and they don't have anyone to hold the wave outside of tower, shove the wave into tower. enemy laner will lose gold/xp and the wave will bounce back to your laner. If the wave is slowpushing into your tower (you have less minions than they do), don't touch the wave unless it's going to crash into tower. This will set up a freeze for your laner. However, if the wave is going to crash into your tower and your laner is dead or in base, take the cs/xp, as otherwise it will go to waste. obviously there is some nuance but that's the basic formula.

Try to picture what that lane will look like in 20-30 seconds when they both respawn and come back to lane. If you can recognize that it'll be in an unfavorable spot for your laner, shove it in to put it back in their favor.

A common situation is that the lane is already slow pushing towards your allied top laner, because they're likely to be extended and vulnerable in those times. Depending on everyone's health, game state, etc after the first gank, sometimes it's a great idea to trim the wave so it stays right where it was and go back for another gank right as the enemy laner comes back.

HUGE Jungle Tip for Mid Lane:

This lane uses a lot of resources to push a wave (mana / hp). If your laner is unable to push out because they are low on either come in and help them push the wave out.

Basically split the wave allowing your laner a reset. As the alternative would be resetting at a poor time on the enemy laner's term.

[Comment 4 | Score: 3]

Think about it this way: generally a laner will want to make the wave crash in to the tower before they feel like they are allowed to back. If you gank a lane and get a kill or force the enemy laner to back, your laner will usually want to hard push the wave in to tower asap so they can also back and spend their gold. Sometimes it is dangerous to do so for them. Like you could leave and the enemy jungler could come and kill them while they're trying to push the wave. Or in bot lane the enemy support could try to stall the wave instead of letting it crash if they're still alive. So they will generally want you to help them push it in to tower so they can back asap.

If everyone is dead except you then you want to just push it in if you can. Or if it's about to crash in to your own tower you can pull the wave away from the tower until the next wave comes so that the

minions aggro your own minions and don't get hit by the tower. If you can do this you are the best jungler ever.

As a p4 midlaner, (we're around the same tier :)) here are some common situations when the jungler ganks me:

Scenario 1: me and the enemy laner both die, wave is in the middle with a slight advantage towards my side (2-3 more minions). In that case, I'm dead anyways, shove the wave and crash it under tower so the opponent doesn't get an advantage either.

Scenario 2: both midlaners die, the wave is in the middle with a slight advantage on the enemy side, in that case leave it alone, it will shove to me, it might be able to set up a freeze and worst case scenario the wave resets

Scenario 3: we get the kill, I'm low hp, and the wave can be crashed. (Anywhere from near their tower to the middle) If I get the kill, idc who takes the minions. If the jg gets the kill, please give me the minions. Shove to tower, if we can get a plating and back out safely, then awesome. If not, just shove and leave.

Scenario 4: we get the kill, the wave cannot be crashed as it's just very close to my tower/leaning towards my side and I won't have enough time/resources to push it back. Leave the wave alone and just let it sit there until I can come back and collect what's left of the wave, maybe thin out the wave a bit depending on how many minions there are.

Scenario 5: we don't get the kill, I die. In this scenario just get the fuck out and don't risk giving

them a double, I've done this to the enemy several times where the jungler greeds for 5 minions then hands me a 300g paycheck.

Other things to keep in mind are summoner spells, wave clear potential, and how much a champion scales. I main Cassiopeia and always take tp, so I don't need my jungler to help with my wave as much after a gank. Worst case scenario I back then tp to clean up the wave. But an Akali with ignite may need more help bc she is notoriously bad to waveclear with. Champions that don't scale as hard technically shouldn't hog the resources if the other champion scales harder (veigar/anivia/Yasuo mid and reksai/lee/shaco jungle) but that can be a hard concept to communicate to ur soloq teammates if you're playing someone that scales compared to the champion that doesn't scale.
