

Title: A good, written wave management guide?

Score:

--- POST CONTENT ---

There are tons of videos out there about wave management, but is there a written guide which is actually good and has a clear structure, so that I could glance on it even while playing?

I mean, I know the basics, like "Freeze - Keep the wave at a certain position until my own wave arrives", "Slow push - just last hit the minions" and "Fast push - kill the minions as fast as possible". It is hard to actually use this theory in-game and know when to do what though.

EDIT: I'm top main

If you have an advantage and can actually kill your laner if he is not close to his turret. Then freeze! He will have to either risk getting killed by you or just have to lose farm and stay at exp range only.

Slow push can be used to either build a larger wave so that you can crash it later (by fast pushing) or just to not push toward enemy side so that it moves slowly.(Safer lane spot)

Fast push is basically you using your abilities and auto attacks to push it as fast as you can. You do this when enemy is missing from lane and you want to go b or if you want to push for plates. (Note that these are general purpose)

Some times your lane opponent is baiting you to push and that is where you have to be extra careful

and recognize your game situation.

(Am i stronger or is he stronger? Is something happening around the map? Do i need to be in a fight soon? can i go and buy items if i push it? Will i be at risk if i push it and he comes and freezes it before i have pushed all the way to the turret?)

[This](https://www.reddit.com/r/summonerschool/comments/l4cqrm/macro_guide_wave_management_guide_6_examples/) guide explains it in a way that's easy to understand. It doesn't go over all the information however it's a good starting point

I found [this guide](<https://mobalytics.gg/blog/wave-management/>) to be very helpful. It doesn't instantly transform you into a wave management master, but it teaches you the right mindset and what to think about when hitting minions.

Take screenshots of the different situations on a simulated environment like practice tool and paint edit some circles and arrows on top with basic indications of the different types of moves to execute or when to prefer it, it should fit all in a single A4 paper size or in a single secondary screen like your phone or tablet while still visible enough to not need to focus on reading it to get it.

Wave management is super in depth man, and as someone who is on their 3rd season and ended up plat, I still don't have a complete grasp on the entire concept. But here are some things I HAVE learned about it that have really improved my play:

- Consider if the opponent would have a hard time farming under their tower. Or at least, check and find out if they do. I typically will push the first couple of waves (more than last hit, you are actively trying to clear first). If they have no problem clearing that, it's really not a great idea to shove unless you need to back or they are dead/gone.

-Even waves that meet in the middle of the lane will wipe each other out completely. If they meet on either side of the middle, the wave closer to its own turret will push out. Think of it this way, whichever wave has less distance to travel gets to set up and start attacking first. That wave will push.

-Freezing can be a good way to punish an opponent and force them to overextend to create a scenario where you can kill them. If their wave is pushing into you, let's say you just shoved a wave into a turret, and the last couple of minions dying to turret held up the next wave for a few seconds. When they start pushing back, you can allow that and only start to thin the wave as they reach your side of the lane AND as your opponent starts to hit your own wave. Golden rule is 4 extra minions in the enemy wave compared to your wave.
