

Title: What to do in this exact scenario (Wave management)?

Score:

--- POST CONTENT ---

I'm playing adc, it's early game, enemy wave is pushing into but won't crash. Enemy duo has recalled. I'm playing VAYNE and ping my support to help me push the wave out, they recall instead.

This has been very common for me recently and always results in me having a big wavestate disadvantage, losing the entire wave or more because Vayne has top 3 worse waveclears in the game. However if I don't push the enemy has a tempo advantage and will almost certainly get plates which might be worse (?) depending on how the lane evolves later.

So really, someone smarter than me, please give me an answer.

I mean it depends on wave state and team comps. If the wave isn't pushing fast into your tower and you have even wave state on your side of the map, you can just trim so it stays that way and then come back to a freeze. If the enemy team has engage comp then I'd try to push and crash the wave to prevent a dive scenario.

If you have slightly more minions in wave, then I'd call for a hard push (missing minions is okay) to crash into turret and recall, but depending on timing you might come back into lane where wave isn't in the middle but kinda frozen/slow pushing to you.

And yea, call for wave push with support if you absolutely need it.

thin out wave freeze and recall
