

Title: Resources on wave management and wards to not die to jungle ganks

Score:

--- POST CONTENT ---

I play adc and I'm finding that jungle pathing seems highly random. As ezreal I often have lane prio and slow push the wave but a decent percentage of the time I get ganked from my own tribush despite warding enemy tribush + river/river bush. Should I just stop pushing and always aim for a neutral wave state and play extremely passively. It genuinely seems impossible not to die to jgl ganks if the jgl wants to gank given the quantity of wards I have and the pathing options available.

Buy a control ward to toss into the bush before moving up. It will cost you 75 gold. Denying a gank is worth 300 gold or more depending if you miss out on additional minions and exp. Control wards also DISABLE other wards near them, so you can use this to your advantage as well.

A level is worth approximately 500g in stats. A kill is worth 300 (depending). Missing minion waves is an extremely punishing consequence early game, so denying ganks is actually really important, and you can deny it all by yourself by spending the 75 gold when you have to. Here is some added perspective.

The goal of a match is to earn more exp and gold than your opponent in order to crush them. You do this through objectives, kills, and minions. Minions are the easiest constant; you can get around 105 gold per Standard Wave and around 155-195 gold with a Canon Wave. Wave control and last hitting are some of the best things you can practice and learn to open up opportunities.

To add on to this, getting really good at macro means you can capitalize off of teammates that die and grab their minions so they don't die pointlessly at the tower. Better you get the gold and exp than no one.

Edit to add, if you are constantly pushing lane, you need to make sure to crash it and retreat until you know you are safe to get plates. Getting a plate won't do you any good if you give the enemy 300g dying for it, and then they will rebound the wave to crash into your tower, and you will lose those minions.

And always ask yourself if you can waste the enemies' time when they come to your lane. Any time they spend in your area is time they are not spending farming their minions/camps, exerting pressure, etc. If the enemy is doing dragon, crash the wave and make them miss the minion exp, then you can either safely harass them before they get back, or you can use that opportunity to eat plates as well.

Junglers operate on "Dead Time" windows, so any of their time that you can waste will always be a good investment.

The pathing of the jungler to your lane is unpredictable, and it's meant to be. The clear of the jungle and when it's 'gank o clock' is very clear if you follow the jungle timing. Check where their jungler starts, this isn't season 10, they will clear one side first, and then maybe gank, before doing the other side, and then maybe gank, the odd shaco, jarvan or nunu may break this habit, but by and large thats how it goes from high bronze up.

Modern junglers cant afford not to farm. So watch where they start, give them time to go to the

opposite side, and you have over a minute and a half of safety. If your fellow bot laners leashed, they're pathing away from you. Check the sups mana on arrival in lane to be sure, if you have no wards in there.

If the jungler is starting the opposite side, you are quite likely to get ganked once they do a full clear, and maybe take scuttle. Some junglers are a bit faster than others in their clear, but meta junglers have to have decent clear times. If their jungler starts opposite sides, you want to ward around 3 minutes so it's in place during their 'downtime', when they have to either gank or watch tiktok vids. Watch your jungler to get an idea of where they are likely to be at as a very rough guide.

Get used to that jungle timer, as the camps reset in the order they were taking, and the jungler will normally get their second clear done in the same order as the first. Jungle positioning is quite predictable when you're used to it.

I think it's more about recognizing how far forward you can be in lane without dying to a jg gank. Or recognizing if you are reacting late to the enemy supp engage and not thinking about why they are engaging/walking forward right now
