

Title: Few simple wave management rules that all lower mmr players can easily pick up

Score:

--- POST CONTENT ---

Learning how minionwaves work can be slightly difficult at first. Here I've put down easy principles that everyone can understand and implement.

- When 2 equal minionwaves meet, on your enemys side of the lane, it will push towards you. No matter what.
- If the lane is not pushing toward you, hard shove to reset it if possible, so the wave won't end up in bad position for you. Keep in mind the next minionwaves arrival time. (The wave has to hit turret)
- The minionwave can be only held on your side indefinitely, if the enemywave has 4 more minions.
- If you have alot of gold or no mana or need to just back after you have just killed the remaining minions and the lane is empty. Stop the enemy wave on their side of the lane, so it will push towards yours, then recall.
- Always try to time your backs on the wave that spawns cannonminion, it spawns every 3rd wave in laning phase.

Once you have a grasp of this in practice, you can start to manipulate this to your advantage, like pushing your or denying the enemy's advantages for example. These points will: improve your cs, you will die less to ganks, especially if you don't have that good map awareness.

What is the logic behind the last rule?

[Comment 2 | Score: 4]

any suggestions on how to break a freeze by an opponent who's ahead? that is the bit i struggle with as i'm learning how to lane

If you are wondering where your enemies reinforcement wave is just look at yours. It sounds stupidly obvious but I got to gold before I realized it.

>Always try to time your backs on the wave that spawns cannonminion, it spawns every 3rd wave in laning phase.

What is the reasoning behind this?

Thanks for the overview!

To freeze the lane, your enemy minion wave have to have 4 more minions than yours but any kind of minion? I mean, does it freeze exactly the same if these 4 minions are 1 warrior and 3 casters or 2 warriors and 2 casters?
