

Title: Wave management in silver (thread number 1000, probably)

Score:

--- POST CONTENT ---

I can for the life of me not figure out wave management. I'm most concerned about early waves, say before level 6 or so. I'm a Darius main and I don't understand what I want to do with the first three waves, like, what do I want to accomplish? I get that this is dependent on who I'm facing. For example: I struggle a lot against Mundo. Do I want to slightly push the first wave, hard push second and try to crash? I know that crashing a wave often leads to it bouncing back and slow pushing towards you. Why would this be desirable? I have yet to find a youtube video that makes wave management clear to me, so if you know of any please link!

If you play Darius in the top lane you should be focused on denying and killing the opponent as much as possible in good matchups.

Wave management on the first 3 levels should really be limited to hitting the creeps as low HP as possible to either encourage a slow push towards you or a very very slow push towards the enemy turret. If it's not frozen (good RoT is 4<minion advantage), you need to build a huge wave to get a good reset or dive/deny under turret.

As Darius you want to have extended trades to make use of your passive bleed and AD stacks. It's better for you to want to run Mundo (or mostly anyone) down the lane.

I'm in silver also but from what I've gathered is you want to be pretty aggressive with your positioning before the wave comes, zone him off of the wave from CS'ing.

Slow push first wave then hard crash 2nd wave into tower; Mundo farms slow. You can probably get a proxy wave in if you can track jungle; otherwise just crash the wave; back off put your ward down and then let him push back into you.

If you keep your HP high enough; he'll try and crash wave, you can just ghost and run him down. Try and time maybe a second or an AA in between your E and W. You want to slow with W first when you chase.. then when the slow wears off you yoink with E.

Get better at dodging his Q (learn the CD timer) or stand behind a minion when he throws it. Even better to block the cannon minion with your body and eat the Q some cases.

You want to deny Mundo as much farm and gold and XP as possible early because he will out scale you if you go even in lane and then eat your towers while you are forced to team fight. (Bc Darius not the best for sieging structures)

If Mundo is dumb and positions bad you can kill him level 1 with ghost ignite.

If Mundo is smart he won't let you get near him and will strictly farm with Q until he gets ult and warmogs

Watch high elo Darius mains to get matchup specific knowledge. In general if you're in a favorable matchup you want to start w and zone them off the first 3 melees. If they don't int into you then you

slow push to wave 3 and kill them on the bounce with ghost. The trick I had to learn was being patient on the bounce. It's okay for them to farm a bit while you wait for the wave to over extend.

Where you want the wave to be depends on the matchup.

In your example as a Darius player, in winning matchups Darius wants a long lane so he can run someone down with ghost. Darius is bad at taking tower plates, and has no way to harass someone under tower.

As a result, you want the lane to be on your side of the lane, in the pocket in front of your tower, but not in your tower range. Now the question becomes, "How do you achieve this lane state?"

As you have identified, when you crash a wave, it will bounce and slowpush towards you. If you don't push the wave at all, it will eventually reach your half of the lane, where you can start trimming minions and freezing the wave there, giving you the long lane you want to run them down in.

With your first few waves, in winning matchups ideally you want to zone the enemy away from the minions, abusing your incredibly strong level 1. This will naturally result in your Wave 1 slow pushing into the enemy, since they are not able to hit the wave and you are last hitting the minions. Then you crash wave 2 into tower. This means that wave 3 will accumulate in their tower range and start slow pushing out, but still on enemy side of the lane. Wave 4 is the wave that will finally push out and get to your side of the lane.

Of course, this is all assuming nobody is actively messing with the wave and leaving it up to its own devices.
