

Title: Wave management as a jungler

Score:

--- POST CONTENT ---

How do you precisely manage the wave as a Jungler, mainly when your laner is back/dead and the enemy laner is either in lane/back/dead.

As a jungle main, it seems harder to understand these situations since you don't play lane yourself, there are so many variables to take into account. I do however understand the basics and probably understand more of wave management than most other junglers, however, I don't feel like it's good enough since most of the time I'm not sure what to do, and end up having to communicate with my laner first whether I push it out/do something also, causing me to lose precious time.

Would appreciate some advice from some higher elo Top/Mid mains

I haven't ever really studied wave management, but this is what I would want as a challenger laner (and what I feel is best for your laner regardless of the elo): When your laner is in lane, it's up to them to decide what they want because of how much gold they may be sitting on, as well as their hp/mana. If your laner has tp, it's again up to them what they want, but if they died, note how long it is until they respawn for the following: If they've been forced to recall or died and the enemy is in lane, you should freeze the wave if possible. If the wave is going to push on its own (there are several more minions on your team), then push it all the way to their tower (make sure that the enemy laner isn't freezing; if the enemy isn't even trying to freeze then don't bother with only a few minions because you'll be wasting time and revealing yourself). If the enemy minions are at

your laners tower, pay attention to when the next minion wave is coming: if it's coming soon, simply last hit so that the wave will freeze towards your laners tower. If it's not coming for a long time it's best to take the entire wave ASAP. If the enemy laner also is backed or dead, it's the same thing with some exceptions. Mainly, if you can't get a good freeze, then push to enemy tower if you can do so quickly enough to deny enemy cs. This requires you to know when they are going to come back to lane (especially note whether they have tp). In general it's a lot harder to push cannon waves so keep that in mind when deciding whether you can push. To clarify, sometimes you push even if you can't deny much cs: this would be if as I said before the minion wave is going to push on its own (and your laner won't reach it by the time that it does). Keep in mind this is all what's best for your laner. Sometimes you need the gold or exp, so it's justified to shove the wave (if enemy isn't there) if you're not going to deny your own laner too much. Lemme know if there's any situation that I missed.

I'm a jungle main, but I'm low silver, so maybe I'm not the best person to give you advice, but I don't see anyone commenting here.

Will you accept advice from a humble low-elo?

I'm no master at this game, but I can at least give some insight as to what I'm thinking whenever the ally jungler is in my lane. It all depends on where the wave is and how well you can push. The two situations where I would want a jungler to touch my wave are the following:

1. I have died or otherwise cannot be in lane, and the wave is crashing under turret. In this instance, by all means take any cs that would die to the turret shots. This only makes sense, as I'm

not there to get them and they would otherwise be wasted. However, if I get to lane in time I'd prefer you not touch the minions as this kind of messes up my own cs patterns under turret.

2. A gank was performed successfully and the enemy laner is backing or has died. This situation depends on the position of the wave in the lane (keep in mind I normally play bot or top, mid may be different). If the wave is past the midpoint of the lane, please help me push! You can even have some cs! Usually at this point I'd like to also back to keep even in gold spent so pushing it forces the wave to crash, denying the enemy laner of those minions and resetting the wave in the middle of the lane. However, if the wave is closer to our side of the map, I'd rather leave it alone. The enemy laner is likely to get back to lane before we can fully shove the wave (and the next that is going to come) under turret. In this instance, I'd rather freeze the wave outside my turret.

Above all, communicating with your laner is probably best, though. Yeah, there are some twats that will yell at you for taking cs under turret, but for the most part if you're questioning whether to push or freeze just ask.

I'm only gold, so I wouldn't give you advice myself. But solo renektan only has good wave management guides, they're short videos. When I play jungle I apply those concepts. If a laner is dead, and their line is frozen, I push it all the way to the other tower so he gets a fresh wave, no gold is wasted, and he can opt to freeze or push. Hope you find what you're looking for, and if you find anything better than SRO, that's particularly for Junglers, please let me know!

Honestly, the only way to consistently find good solutions for such a problem is to play a bit of top/mid yourself. That way you'll not only know which one is the best action to take in lane, but more

importantly, what you have to avoid at all costs.

There are plenty of scenarios where not taking any drastic actions regarding wavecontrol doesn't immediately lead to an advantage or disadvantage. Your laner wanted a slowpush, but you taxed 2 minions and now it's not as perfectly playing out as possible...whatever. Your laner is behind and you gave the enemy the opportunity to freeze after pushing out one wave, then walk to the other side of the map...something you should be aware of and prevent from ever happening.

---

Especially regarding a decision to shove out, you need to be quick, so asking a laner first and waiting for a response is not fast enough (and a correct response is not guaranteed either). There simply is no good answer to that problem in soloqueue, in 5v5 your mid/top will make a call, but this is actually one of the few things that cannot be communicated with pings very well unless you arrange a code.

---

Something that imho tremendously helps though, both in terms of wavemanagement for laners, but also to anticipate a potentially decent gank setup in the near future, is to raise awareness of cannon waves. At the start it's every 3rd wave and later on becomes every 2nd wave.

Not only can you directly play around those waves (as especially early on, the lane levelups happen on those waves), but it also raises general awareness for minion positions and wavestates = better decisions. And like with every aspect of lol, if you spend a lot of attention on it, you figure out stuff and learn something you can use in the future.
