

Title: A few things about wave management

Score:

--- POST CONTENT ---

I main adc and I find myself quite decent at wave management but I feel like I sometimes make mistakes.

1. If the enemy overstays after my recall and they don't get the shove in do I want to freeze or shove under their turret?
2. How do I differentiate slow push from freeze? They both start near the turret with similar amount of minions but some people say "it won't freeze it will slowpush" and I always thought that slowpush is just freeze if no one contests it because of those few autoattacks you need to use?
3. With the new dragon changes, after a kill is it more worth to shove the wave and get 1 plate or leave it and help with drake?
4. If the enemy recalls and I know I can't shove under their turret do I want to push it so it's on their side of the map or leave it in the middle? If I push it will slowpush towards me which is nice but I risk a freeze?
5. What do I do if the enemy is strong aggressive (say Draven) and I am smth like Vayne I cannot fight with and he doesn't push and the wave starts going towards them. I start to overextend and it's bad but I do have to lasthit the wave at least...
6. How do I manage waves after turrets drop? It's black magic for me. I usually just push it to their side of the map so someone has to go pick it up
7. If I do not have ideal 3 casters for a freeze but I have like one so it will keep the wave for a short period so it won't freeze but will be a bit on my side of the map making me safer should I do it or is there some downside (except of less priority ofc)
8. I know that I usually don't want to push with hook supports and I do want to push with mages for free poke but what do I do with healers?

I know it is a lot so I will be grateful for any advice.
